

makeCurvesCompitable

Developer utility: make selected curves share degree and knots, and print a before / after report.

What it does

Every surface-from-curves tool here first makes curves compatible. This feature exposes that step for checking: what degrees, knots and control-point counts the curves have before and after.

Use it when

- Diagnose a skinning or Gordon problem
- Inspect curve structure

Degree elevation and knot union, exact.

The dialog

Parameter	What it means
Edges to make compatible	The curves (in selection order).
Print Report?	Degrees, control-point counts, knots, rational flags, match checks -- before and after.
Create wire?	Output the compatible curves as wires compatibleBSpline_i (shapes unchanged).

Tips and limits

Name and description

The feature name is misspelled and its description is empty.

Rational input

Edges are read without forcing non-rational.
