

Trim curve (reference copy)

A verbatim copy of Onshape's own Trim curve (Move curve boundary), kept to compare with Trim curve +. Use the native feature.

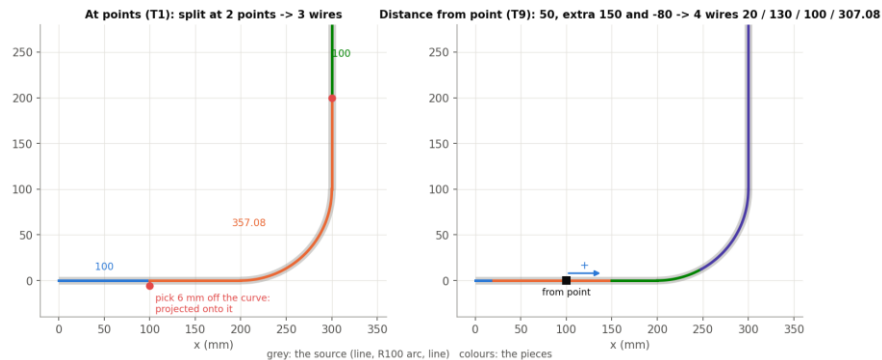

What it is

OS_Trim.fs is PTC's MIT-licensed source of native Trim curve with only the version bumped. It exists so Trim curve + can be compared with it; nothing imports it.

Use it when

- Never in models: use the native Trim curve
- Reading how the native feature works

What Trim curve + adds: cuts at exact positions.

The dialog

Parameter	What it means
Move curve boundary type	Trim / Extend.
Curves to adjust	Non-sketch wires.
End condition	(Extend) Blind + distance, or Up to entity; then extension shape.
Up to entity	(Trim) where to trim.
Help point	Picks the end / side.
Opposite direction	Flip.
